Task 1.1

- Read lab documents, JDBC tutorial and source code "*JDBC.java*"
- Set up environment for coding
- Test method *testJDBCQuery()*
  - Query: *SELECT * FROM Orf_Motif WHERE num=7*
  - *This is done without an index*
- *Useful commands*
  - Open a Windows cmd or a MAC terminal; change to fold lab1 (or any others); compile *JDBC.java* using:
    - *javac -cp . JDBC.java*
  - If successful then execute following command to produce result
    - *Windows: java -cp mysql-connector-java-8.0.18.jar; JDBC*
    - *MAC OS: java -cp mysql-connector-java-8.0.18.jar:. JDBC*

Task 1.2

- Query is the same as *task 1.1* except search is done using an index on search key "num".
- Download file "JDBCandIndex.java" and Test method *testJDBCQueryWithIndex()*
  - Sample query: *SELECT * FROM Orf_Motif WHERE num=7*

Task 2

- Implement a new functionality which can print time taken for queries without and with an index, respectively.
  - Use the same query as in Task 1
  - Query time only needs to be considered for method
    - *rs = stmt.executeQuery(sql);*
  - *Observe the time difference and see if an index can support queries more efficiently.*
